1.0 GENERAL INFORMATION

1.0 GENERAL INFORMATION

1.1 System Overview

- This is the MPX operating system.
- This system will allow you to control your computer system through simple commands
- The design for this operating system build was created in C.
- The operating system is run in a Linux environment
- The system is booted using GRUB

1.2 Project References

References used for this system were slides provided in the CS450 class by Seth Theeke and Mason Greathouse.

1.3 Authorized Use Permission

Unauthorized duplication, distribution of this computer software is strictly prohibited.

1.4 Points of Contact

If any issues are found with this software and/or assistance is needed, call your mother because you're on your own.

1.5 Acronyms and Abbreviations

Process Control Block- PCB

2.0 SYSTEM SUMMARY

2.0 SYSTEM SUMMARY

2.1 System Configuration

This system will be used to demonstrate simple commands, and was designed to provide an experience in developing systems, and increase knowledge on how operating systems work with system hardware.
(Will add more as time goes on).

2.2 Data Flows

At the moment simple data flows are being used from input to the keyboard and output to the computer screen.

3.0 GETTING STARTED

3.0 GETTING STARTED

3.1 Logging On

To access the operating system an emulator system is used and an emulated booting sequence is initiated.

3.2 Command Line

This system uses a command line interface. Simple commands can be used.

3.2.1 Help

At any time while using this operating system you can type help and receive the list of commands that are available. Help gives an overview of all the commands available for use. Executed by typing “help”.

3.2.2 Version

Shows the working version of the software. This is updated every time the software is updated and revised. Executed by typing “version”

3.2.3 Set Date

Allows the user to set the date for the operating system. Date is entered in the MM/DD/YY format. Executed by typing “setdate” and then entering the date in the correct format.

3.2.4 Get Date

Displays the date to the display. Date is displayed in the MM/DD/YY format. Executed by typing “getdate”.

3.2.5 Set Time

Allows the user to set the time for the operating system. Time is set in the HH:MM format. Executed by typing “settime” and entering the time in the correct format.

3.2.6 Get Time

Displays the time to the display. Time is displayed in the HH:MM format. Executed by typing “gettime”

3.2.7 Suspend

Gets Process Control Block (PCB) name from the user and Puts the PCB in the suspended state.

3.2.8 Resume

Puts process in not suspended state, might require the changing of queues if multiple queues are being used. Applicable process will resume.

3.2.9 Set Priority

Gets Process Control Block (PCB) name and new priority from user, system checks validity and the changes the position of the PCB based on the new designated priority.

3.2.10 Show PCB

Gets Process Control Block (PCB) name from the user and displays all information about the PCB.

3.2.11 Show all Processes

Shows information for all Process Control Blocks (PCBs) in all queues. It displays the process name, the state, its status, and its priority.

3.2.12 Show Ready Processes

Shows all the processes that are in the ready state. Shows the processes in the order they are in the queue.

3.2.13 Show Block Processes

Shows all blocked processes.

3.2.14 Create PCB

Allocates and sets up a new Process Control Block (PCB) and inserts it into the ready queue

3.2.15 Delete PCB

Removes an existing Process Control Block (PCB) from its queue and frees its memory

3.2.16 Block

Gets Process Control Block (PCB) name from the user and checks that the PCB with that name exists. Then places the PCB in the blocked state.

3.2.17 Unblock

Gets process name from the user and places the process (PCB) in the ready state.

3.3 Exit System

3.3.1 Shutdown

Will safely shutdown the operating system. Loss of data and corruption could occur if not properly shut down. Executed by typing “shutdown”.
